

Chemistry Scheme of Learning

Year 9 – Term 5, Topic 2

Intent – Rationale

The pupils start Topic 2 ‘Bonding’. They briefly touched on this when they studied atomic structure in Term 1, but they are now going to learn about all of the different types of chemical bonds, as well as how this affects the properties of the substance. This is a concept that underpins many other topics in chemistry, and it is one that is revisited frequently throughout. They will learn how to draw diagrams to represent different chemical bonds and carry out practical investigations to understand how the type of bonding affects the chemical properties.

Sequencing – what prior learning does this topic build upon?	Sequencing – what subsequent learning does this topic feed into?

## Chemistry Scheme of Learning

### Year 9 – Term 5

#### Intent – Concepts

**What knowledge will students gain and what skills will they develop as a consequence of this topic?**

##### Know

- Can I explain how a covalent bond forms in terms of electronic structure? Can I describe metallic bonding? Can I identify the type of bonding in a substance from the formulae?
- Can I use data to determine the state of a substance at a given temperature
- Can I explain why ionic compounds have a high melting point? Can I explain how the size of molecules affects melting and boiling points?
- Can I explain what an alloy is?

##### Apply

- Can I draw dot and cross diagrams or ball and stick models to represent small molecules? Can I explain how metal atoms form giant structures?
- Can I use the particle model to describe how the energy, movement and attraction between particles change as a substance is heated or cooled? Can I explain in terms of particles, energy or temperature when a substance is at melting or boiling point?
- Can I explain why ionic compounds conduct electricity when molten or in solution, but not when solid? Can I justify in terms of properties that a compound has ionic bonding? Can I explain why small molecules and polymers don't conduct electricity?
- Can I justify why alloys are used more often than pure metals?

##### Extend

- Can I suggest how double and triple covalent bonds form? Can I suggest how the properties of a double bond are different to the properties of a single bond? Can I evaluate different models of metallic bonding? Can I compare the different types of chemical bonds?
- Can I suggest why substances have different melting and boiling points? Can I describe the factors that affect the rate of evaporation?
- Can I explain the movement of ions in solution or when molten? Can I apply the ionic model to make predictions about the physical properties of ionic compounds? Can I identify substances that would have weak intermolecular forces?
- Can I explain in detail using labelled diagrams, how alloying affects the structure and bonding in metals and its effects on properties

**What subject specific language will be used and developed in this topic?**

**What opportunities are available for assessing the progress of students?**

<u>Word</u>	<u>Definition</u>
<b>Anion</b>	A negative non-metal ion
<b>Cation</b>	A positive metal ion
<b>Covalent bond</b>	When two atoms share a pair of electrons. This is a result of electrostatic attraction between the nuclei of the atoms and the shared electrons
<b>Delocalised Electron</b>	A bonding electron which is no longer associated with any particular atom. It is free to move through the structure
<b>Ductile</b>	The ability to draw a metal into wires
<b>Electrostatic Force</b>	The attraction between opposite charges
<b>Intermolecular force</b>	The attraction between individual molecules in a <u>covalently</u> bonded substance
<b>Ion</b>	A charged particle produced by the loss or gain of electrons
<b>Ionic Bond</b>	The electrostatic force between oppositely charged <u>ions</u>
<b>Lattice</b>	A huge 3D network of atoms or ions
<b>Malleable</b>	The ability to hammer a material into shape
<b>Metallic bond</b>	The electrostatic attraction between the positive metal ions in the lattice and the delocalised electrons
<b>Molecule</b>	Two or more atoms <u>covalently</u> bonded together. Molecules can be elements or compounds

- 6 mark question on metallic bonding
- 6 mark question comparing ionic and covalent bonding
- Past paper questions

<b>Molecular Formula</b>	The chemical formula that shows the actual number of atoms in a particular molecule	
<b>Polymer</b>	A substance made from very large molecules that form from many repeating units called monomers	

Intent – Concepts

Lesson title	Learning challenge	Higher level challenge	Suggested activities and resources
<b>Topic 2 Lesson 3 Covalent Bonding</b>	Can I explain how a covalent bond forms in terms of electronic structure? Can I draw dot and cross diagrams or ball and stick models to represent small molecules?	Can I suggest how double and triple covalent bonds form? Can I suggest how the properties of a double bond are different to the properties of a single bond?	
<b>Topic 2 Lesson 4 Metallic</b>	Can I describe metallic bonding? Can I explain how metal atoms	Can I evaluate different models of metallic bonding?	

<b>Bonding</b>	form giant structures?		
<b>Summary and Review</b>	Can I identify the type of bonding in a substance from the formulae?	Can I compare the different types of chemical bonds?	
<b>Topic 2 Lesson 5 States of Matter</b>	Can I use data to determine the state of a substance at a given temperature? Can I use the particle model to describe how the energy, movement and attraction between particles change as a substance is heated	Can I suggest why substances have different melting and boiling points? Can I describe the factors that affect the rate of evaporation?	

	<p>or cooled? Can I explain in terms of particles, energy or temperature when a substance is at melting or boiling point?</p>		
<p><b>Topic 2 Lesson 6 Properties of Ionic Compounds</b></p>	<p>Can I explain why ionic compounds have a high melting point? Can I explain why ionic compounds conduct electricity when molten or in solution, but not when solid? Can I justify in terms of properti</p>	<p>Can I explain the movement of ions in solution or when molten? Can I apply the ionic model to make predictions about the physical properties of ionic compounds?</p>	

	es that a compound has ionic bonding?		
<b>Topic 2 Lesson 7 Properties of Small Molecules</b>	Can I explain how the size of molecules affects melting and boiling points? Can I explain why small molecules and polymers don't conduct electricity?	Can I identify substances that would have weak intermolecular forces?	
<b>Topic 2 Lesson 8 Properties of Metals</b>	Can I explain what an alloy is? Can I justify why alloys are used more often than pure metals?	Can I explain in detail using labelled diagrams, how alloying affects the structure and bonding in metals and its effects on properties
